Assignment Project Exam Help

Why study the *principles* of programming languages?

<https://powcoder.com>

Add WeChat powcoder

Why study the *principles* of programming languages?

1. Better Understanding of Programming Language (PL) Theory

- Programming language defines computation models tailored to *think about* and *solve* problems
- It is believed that the depth at which we think is influenced by the expressive power of the language which we communicate our thoughts
- While it may be possible to solve every problem in any reasonable language, some problems are inherently suitable for specific ways of thinking and programming.

In 2009, Twitter switched (part of its server infrastructure) from Ruby on Rails to Scala because Scala better matched their need for long running threads, high performance under heavy loads, more robust code via compile-time type checking, and ease of composable functions rooted in functional programming.

— “Twitter on Scala”

A Conversation with Steve Jenson, Alex Payne, and Robey Pointer

Using LISP for my company's store front application, which eventually became "Yahoo Store", allow us to develop and deploy new functionality more rapidly than our several dozen competitors (who primarily use C++ and CGI script). Elements of LISP, meta-programming enable programs to create, modify, and execute new pieces of code, and make implementing complex features much easier.

— Paul Graham.

Hackers and Painters: Big Ideas from the Computer Age.

Add WeChat powcoder

Understanding the fundamentals in programming languages helps one critically *compare* and *choose* the most appropriate abstractions for describing and solving a particular problem.

Why study the *principles* of programming languages?

2. Better Learning of New Languages

- The languages and models in practice change constantly.
- Advances in our fields change how we model and express computation.

Many widely used languages such as Java, C#, go, and many scripting languages, largely perform automatic memory management via *garbage collection* because of assignments

- Advance in processor and memory performance
- Improvement in collection techniques

Add WeChat powcoder

Garbage collection is a technique that was invented by John McCarthy around 1959 to simplify manual memory management in Lisp.

Add WeChat powcoder

Why study the *principles* of programming languages?

3. Better Design of Domain Specific Languages (DSL)

- One may not have to design general purpose programming language, but very likely domain-specific API, programming language, and virtual machine (VM) during his/her career.
- DSL exploits properties of the intended domains to facilitate writing specific types of algorithms.
- However, lack of knowledge of programming fundamentals can lead to DSL that are difficult to understand/use or need later repair.

Example: in earlier versions of LISP, the dynamic scope make higher order abstractions unusable in many cases and lead to problems in type checking and optimizations. This problem had to be fixed in LISP.

Course Goals

- To gain understanding of the basic structure of programming languages:
 - Data visibility, naming conventions, procedure abstraction and etc.
- To study different computing models and language paradigms:
 - Functional (LISP/*Scheme*), imperative (*C*), logic (*Prolog*), object-oriented (Java/*C++*), parallel (*OpenMP/CUDA*), ...
 - To ensure an appropriate language is chosen for a task
- To know the principles underlying all programming languages:
 - To make learning new programming languages easier
 - To enable full use of a programming language
 - To understand the implementation of different programming languages

Programming languages embody many concepts central to all of computer science, including abstraction, generalization and automation, computability, and resource management.

Course Information

Prerequisites:

- CS 205 (Introduction to Discrete Structures)
- CS 211 (Computer Architecture)

Important facts:

- Lecturer: Prof. Zheng Zhang
- Lectures: Wednesday 10:20am - 11:40am
Friday 3:20pm - 4:40pm
- TAs: Yanhao Chen
Junchi Jiang
Lau Chun Leung
- Recitations: TA/Recitation Assignment TBA
- Office Hours: TBA

Recitations and Office Hours Start Next Week

Course Information

Basis for grades (subject to changes):

- 10% homework (about 8 homework sets, lowest one will be dropped)
- 25% mid-term exam
- 35% final exam (cumulative)
- 30% three major programming projects
- Up to 5% extra-credit work in homework or projects

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

If you do better in final exam than in mid-term, your midterm grade will be dropped, and your final exam will count 60% of the final grade.

Course Information

Textbook:

- Required:
“Programming Language Pragmatics” by Michael L. Scott, 4th Edition, Morgan Kaufmann (Elsevier), 2015.
- Suggested:
“Compilers: Principles, Techniques, and Tools 2/E (2007) ” by Aho, Lam, Sethi, Ullman, 2nd Edition, Addison-Wesley, 2007

Required: Scott

Suggested: ALSU

Course Information

Online discussion:

- There will be a discussion forum on Sakai.
 - All questions regarding homework and projects should be posted here.
 - Please DO NOT post solutions.
- All questions will be answered in Sakai (in no more than 72 hours).
 - Before you ask a question, check if a similar question has been asked.
 - Plan ahead and try not to ask questions in the last minute.
 - Be specific and avoid asking general questions.

Assignment Project Exam Help

Course Information

Academic Integrity

- Read-protect your directories and files (ilab)
- No group projects
- Will use software tools to check code plagiarism

IMPORTANT INFORMATION will be posted on Sakai

- Grading of homework and projects
- Instructions of how to submit programming projects

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Email TAs and me:

- Subject line has to start with 314
E.g., “314: Question about my midterm exam”
- No project and homework questions via email;
Please post them on Sakai discussion forum.

Course Information

Special permission numbers:

- Currently all three sections are full.
- Will try to accommodate as many students as I can. **Assignment Project Exam Help**
- Talk to me after class. **<https://powcoder.com>**

Why Use Anything Besides Machine Code?

This is a **C** program that uses two one-dimensional arrays **a** and **b** of size **SIZE**. The arrays are initialized, and then a sum operation is performed. The size of the arrays and the result of the sum is printed out.

```
#include <stdio.h>
#define SIZE 100
int main() {
    int a[SIZE], b[SIZE];
    int i, sum;
    for (i=0; i<SIZE; i++) {
        a[i] = 1;
        b[i] = 2;
    }
    sum = 0;
    for (i=0; i<SIZE; i++)
        sum = sum + a[i] + b[i];
    printf("for two arrays of size %d, sum = %d\n", SIZE, sum);
}
```

Why Use Anything Besides Machine Code?

Need for high-level programming languages for

- Readable, familiar notations
- Machine independence (portability)
- Consistency checks during implementation
- Dealing with scale

<https://powcoder.com>

The art of programming is the art of organizing complexity.

- *Dijkstra, 1972*

Compilers

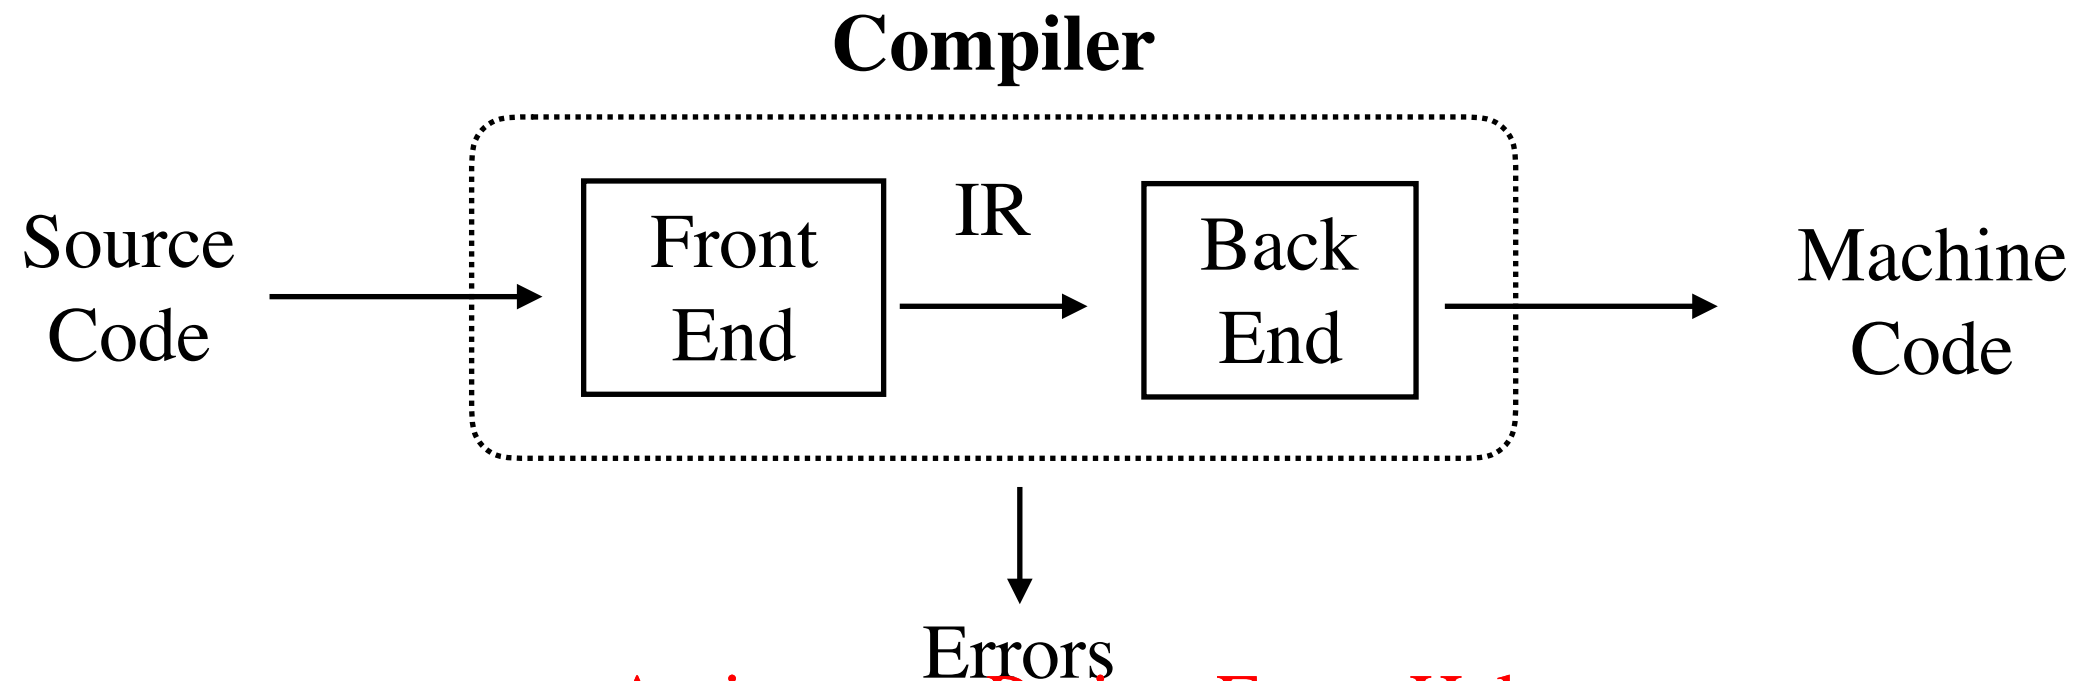

Implications:

- Recognize legal (and illegal) programs
- Generate correct code
- Manage storage of all variables and code
- Need format for object (or assembly) code

Big step up from assembler to higher level notations

Traditional Two-Pass Compilers

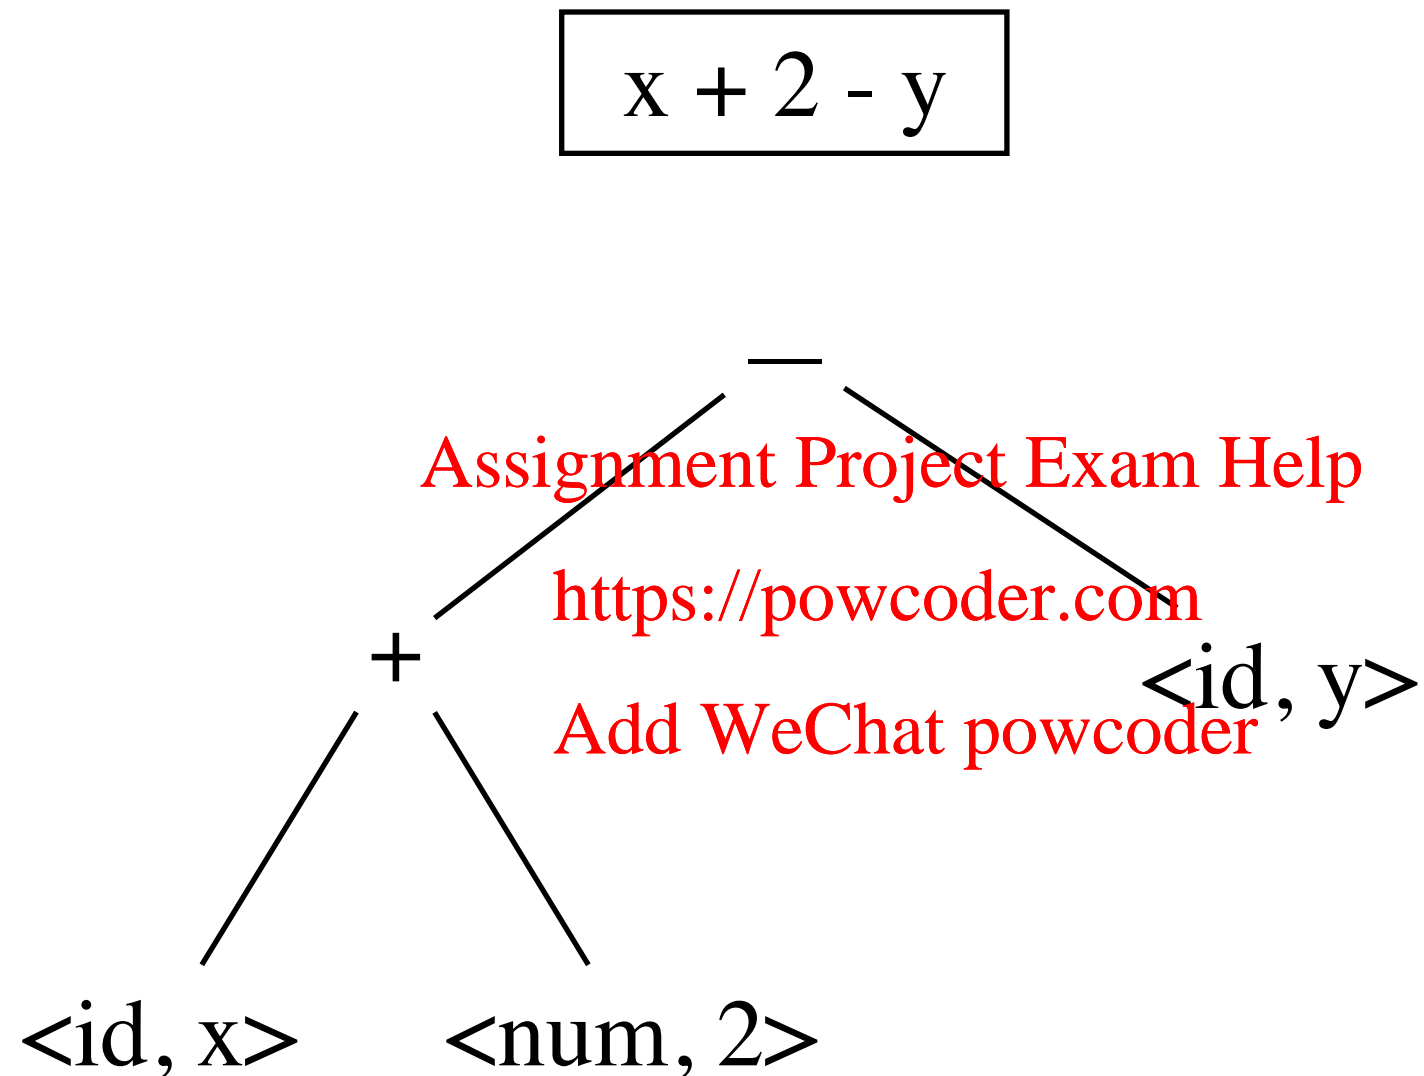

Implications:

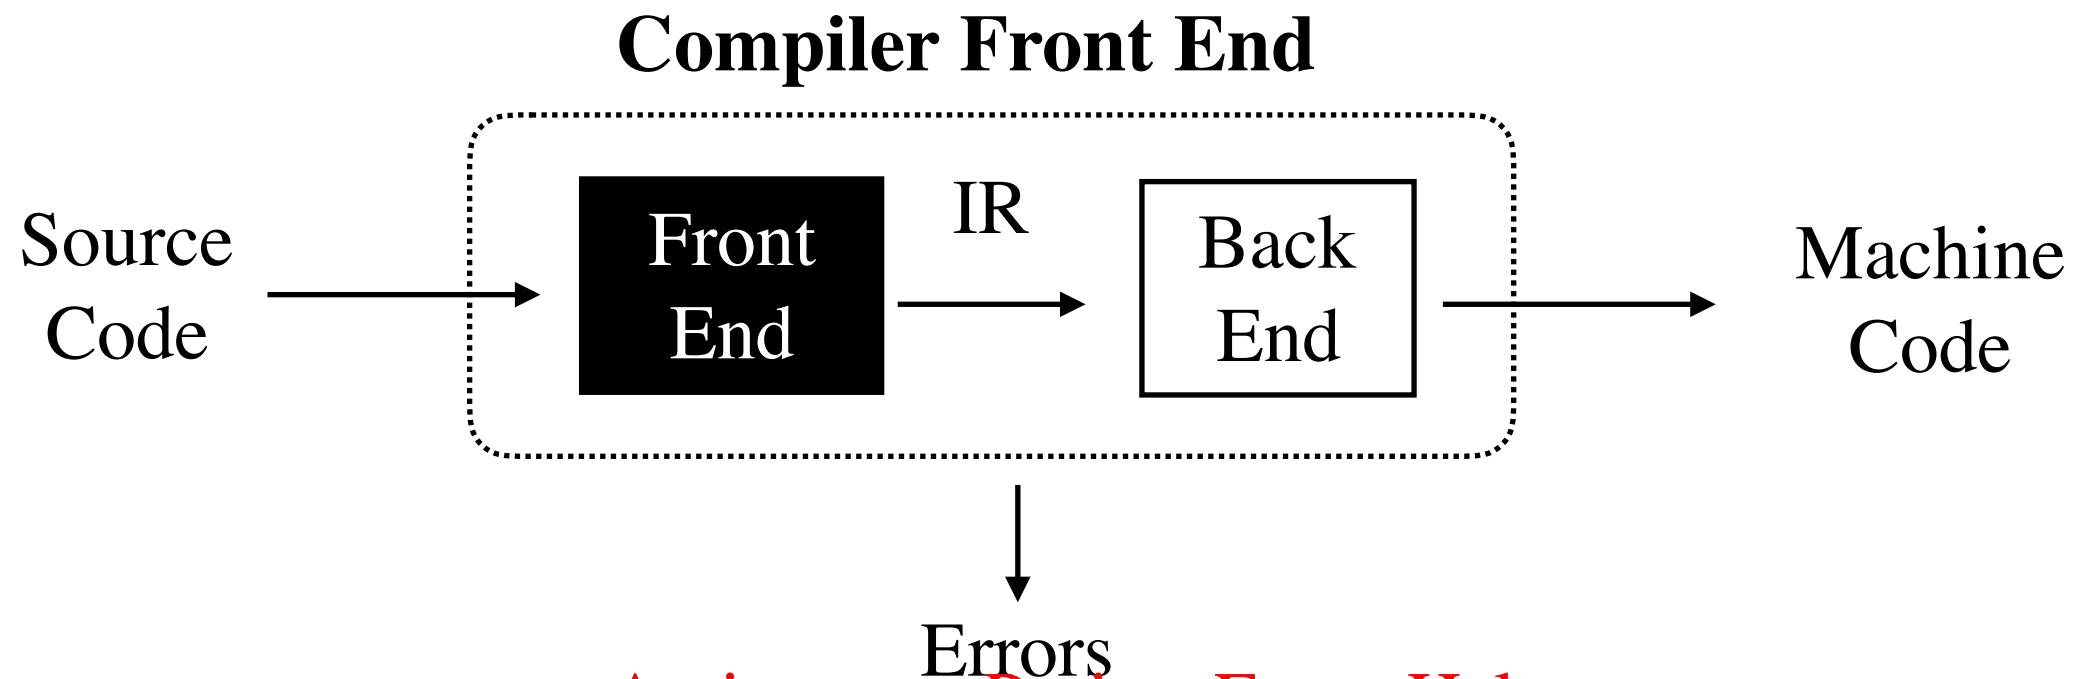

- Intermediate representation (IR)
- Front end maps legal code into IR
- Back end maps IR onto target machine
- Simplify retargeting
- Allows multiple front ends and back ends

Example IR: Abstract Syntax Tree

Compilers often use an abstract syntax tree.

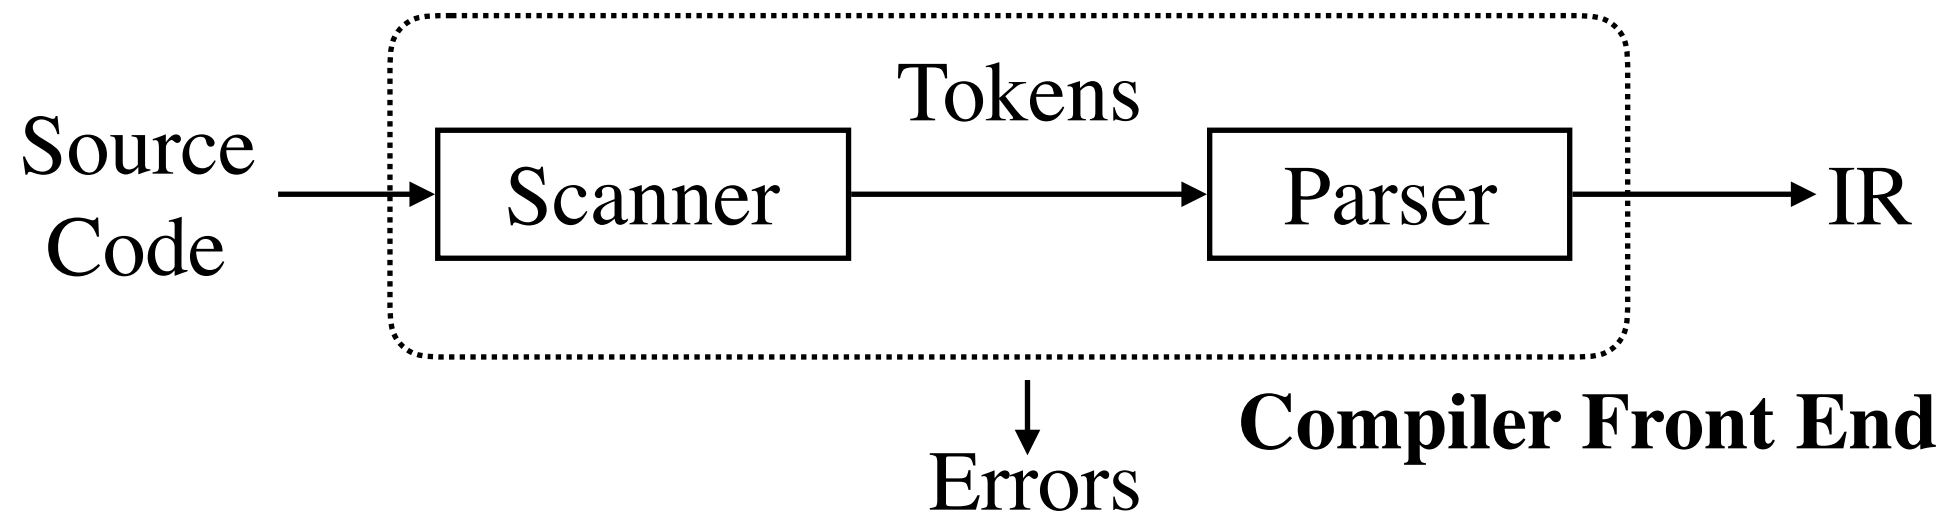

Traditional Two-Pass Compilers

Implications:

- Intermediate representation (IR)
- Front end maps legal code into IR
- Back end maps IR onto target machine
- Simplify retargeting
- Allows multiple front ends and back ends

Front End

Syntax & semantic analyzer, IR code generator

Assignment Project Exam Help

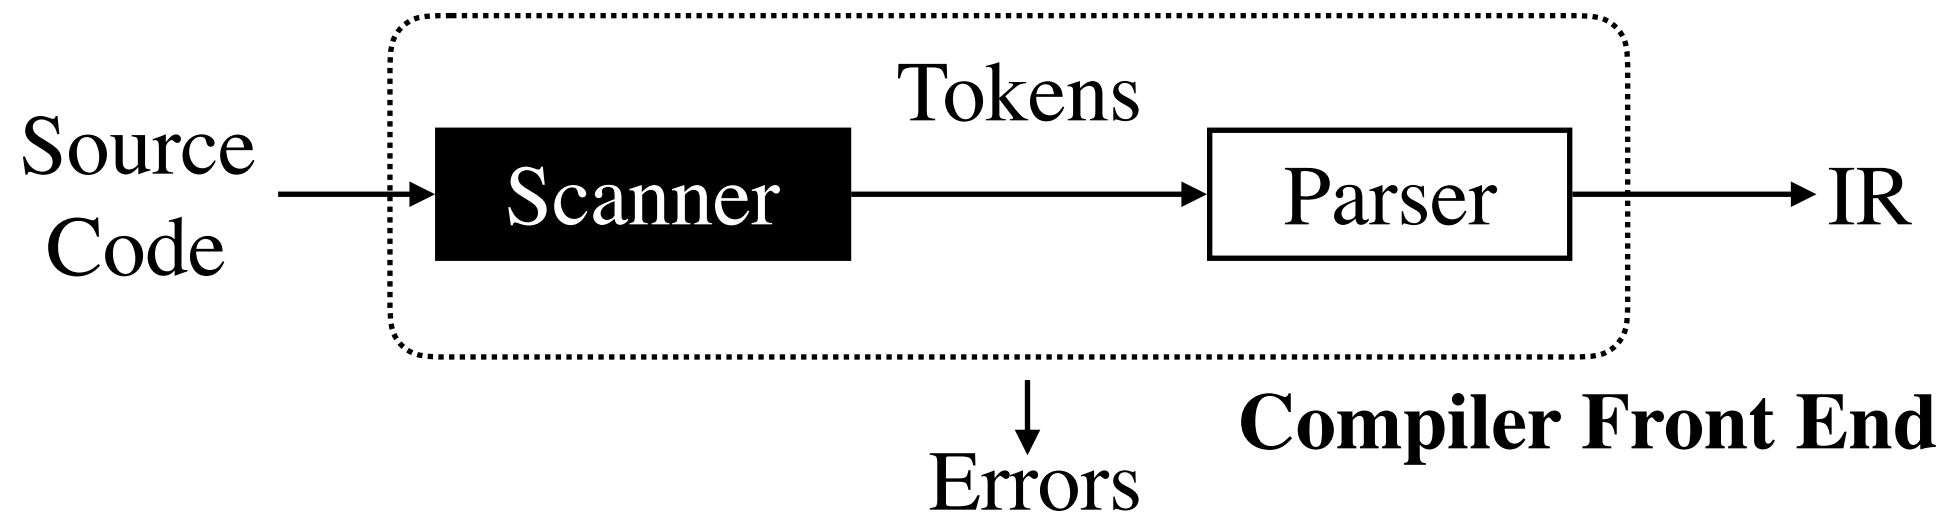

Front End Responsibilities: <https://powcoder.com>

- Recognize legal programs
- Report errors
- Produce IR
- Preliminary storage map
- Shape the code for the back end

Add WeChat powcoder

Much of front end construction can be automated

Scanner

Scanner

- Maps characters into tokens — the basic unit of syntax
 $x = x + y;$
becomes
 $\langle \text{id}, x \rangle = \langle \text{id}, x \rangle + \langle \text{id}, y \rangle ;$
- Character string for a token is a lexeme
- Typical tokens: number, id, +, -, *, /, do, end
- Eliminates white space (tabs, blanks, comments)
- A key issue is speed
 \Rightarrow use specialized recognizer (**lex**)

Parser

Parser:

- Recognize context-free syntax (Context Free Grammars)
- Guide context-sensitive analysis
- Construct IR(s)
- Produce meaningful error messages
- Attempt error correction

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Parser generators mechanize much of the work

Syntax and Semantics of Programming Languages

Syntax:

Describes what a legal program looks like

Semantics:

Describes what a legal program means

Formal Language Definition:

A formal language L is a (possibly *infinite*) set of sentences (*finite* sequences of symbols) over a finite alphabet Σ of (terminal) symbols: $L \subseteq \Sigma^*$

<https://powcoder.com>
Add WeChat powcoder

Examples:

- $L = \{ \text{identifiers of length 2} \}$ with $\Sigma = \{a, b, c\}$
- $L = \{ \text{strings of only 1s and only 0s} \}$
- $L = \{ \text{strings starting with \$ and ending with \#, and any combination of 0s and 1s in between} \}$
- $L = \{ \text{all syntactically correct Java programs} \}$

Syntax and Semantics: How does it work?

Syntactic representation of “values”

What do the following syntactic expressions have in common?

V

101

\$ |||| #

3+ 19 – 17

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Syntax and Semantics: How does it work?

Syntactic representation of “values”

What do the following syntactic expressions have in common?

V

101

\$ |||| #

3+ 19 – 17

Assignment Project Exam Help

Answer: They are possible representations of the integer value “5” (written as a decimal number)

<https://powcoder.com>

Add WeChat powcoder

What is computation?

Possible answer: A (finite) sequence of syntactic manipulations of value representations ending in a “*normal form*” which is called the result. *Normal forms* cannot be manipulated any further.

Syntax and Semantics: How does it work?

Here is a “game” (rewrite system):

Input: Sequence of characters starting with \$ and ending with #, and any combination of 0s and 1s in between.

Rules: You may replace a character pattern **X** at any position within the character sequence on the left-hand-side by the pattern **Y** on the right-hand-side: $X \Rightarrow Y$:

Rule 1 $\$1 \Rightarrow 1\&$

Rule 2 $\$0 \Rightarrow 0\$$

Rule 3 $\&1 \Rightarrow 1\$$

Rule 4 $\&0 \Rightarrow 0\&$

Rule 5 $\$ \# \Rightarrow \rightarrow A$

Rule 6 $\& \# \Rightarrow \rightarrow B$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Replace patterns using the rules as often as you can.
When you cannot replace a pattern any more, stop.

Syntax and Semantics: How does it work?

Example input:

\$ 0 0 #

\$ 0 0 # is rewritten as **0 \$** 0 # by rule 2

Rule 1	\$1 \Rightarrow 1&
Rule 2	\$0 \Rightarrow 0\$
Rule 3	&1 \Rightarrow 1\$
Rule 4	&0 \Rightarrow 0&
Rule 5	\$# \Rightarrow \rightarrowA
Rule 6	&# \Rightarrow \rightarrowB

Assignment Project Exam Help

Questions:

- Can we get different “results” for the same input string?
- Does all this have a meaning (**semantics**), or are we just pushing symbols?

Syntax and Semantics: How does it work?

Example input:

$\$ 0 0 \#$

$\boxed{\$ 0} 0 \#$ is rewritten as $0 \boxed{ \$ } 0 \#$ by rule 2

$0 \boxed{ \$ 0 } \#$ is rewritten as $0 \boxed{ 0 \$ } \#$ by rule 2

$0 0 \boxed{ \$ \# }$ is rewritten as $0 0 \boxed{ \rightarrow A }$ by rule 5

no more rules can be applied (**STOP**)

<https://powcoder.com>

More examples:

$\$ 0 1 1 0 1 \# \rightarrow B$

$\$ 1 0 1 0 0 \# \rightarrow A$

$\$ 1 1 0 0 1 \# \rightarrow B$

Rule 1	$\$1 \Rightarrow 1\&$
Rule 2	$\$0 \Rightarrow 0\$$
Rule 3	$\&1 \Rightarrow 1\$$
Rule 4	$\&0 \Rightarrow 0\&$
Rule 5	$\$ \# \Rightarrow \rightarrow A$
Rule 6	$\& \# \Rightarrow \rightarrow B$

Add WeChat powcoder

Questions:

- Can we get different “results” for the same input string?
- Does all this have a meaning (**semantics**), or are we just pushing symbols?

Syntax and Semantics of Prog. Languages

The syntax of programming languages is often defined in two layers:
Tokens and Sentences

- *Tokens - basic units of the language*

Question: How to spell a token (word)?

Answer: Regular expressions

[Assignment Project Exam Help](https://powcoder.com)

- *Sentences - legal combinations of tokens in the language*

Question: How to build correct sentences with tokens?

Answer: (context - free) grammars (CFG)

- E.g., Backus-Naur form (BNF) is a formalism used to express the syntax of programming languages.

Formalisms for Lexical and Syntactic Analysis

Two issues in *Formal Languages*:

- Language Specification → formalism to describe what a valid program (sentence) looks like.
- Language Recognition → formalism to describe a machine and an algorithm that can verify that a program is valid or not.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Token sequence

Lexical Analysis (Scott 2.1, 2.2)

Tokens (*Terminal Symbols of CFG, Words of Lang.*)

- Smallest “atomic” units of syntax
- Used to build all the other constructs
- Example, C:

Assignment Project Exam Help
keywords: for if goto volatile...
<https://powcoder.com>
= * / - < > == <= >= <> () [] ; := . , ...
Add WeChat powcoder
number: (Example: 3.14 28 ...)
identifier: (Example: b square addEntry ...)

Lexical Analysis (cont.)

Identifiers

- Names of variables, etc.
- Sequence of terminals of restricted form;
Example, in C language: **A31**, but not **1A3**
- Upper/lower case sensitive?

Assignment Project Exam Help

Keywords

- Special identifiers which represent tokens in the language
- May be reserved (reserved words) or not
 - E.g., C: “**if**” is reserved.

Delimiters – When does character string for token end?

- Example: identifiers are longest possible character sequence that does not include a delimiter.
- Most languages have more delimiters such as ‘_’, new line, keywords, ...

Regular Expressions

A syntax (notation) to specify regular languages.

RE r

Language L(r)
