# Review: Top-Down Parsing - LL(1)

Assignment Project Exam Help

Basic Idea:

<https://powcoder.com>

- The parse tree is constructed from the root, expanding non-terminal nodes on the tree's frontier following a **leftmost** derivation.
- The input program is read from **left** to right, and input tokens are read (consumed) as the program is parsed.
- The next non-terminal symbol is replaced using one of its rules. The particular choice has to be unique and uses parts of the input (partially parsed program), for instance the first token of the remaining input.

# Another LL(1) Parsing Example

---

Consider this example grammar:

$$\begin{aligned}\langle \text{id\_list} \rangle &::= \mathbf{id} \langle \text{id\_list\_tail} \rangle \\ \langle \text{id\_list\_tail} \rangle &::= \mathbf{, id} \langle \text{id\_list\_tail} \rangle \\ \langle \text{id\_list\_tail} \rangle &::= \mathbf{;} \end{aligned}$$

Assignment Project Exam Help

Add WeChat powcoder

# Another LL(1) Parsing Example

---

Consider this example grammar:

```
id_list      ::= id id_list_tail  
id_list_tail ::= , id id_list_tail  
id_list_tail ::= ;
```

Assignment Project Exam Help

<https://powcoder.com>

How to parse the following input string?

Add WeChat powcoder

A, B, C;

# Another LL(1) Parsing Example

$\text{id\_list} ::= \mathbf{id} \text{id\_list\_tail}$   
 $\text{id\_list\_tail} ::= \mathbf{, id id\_list\_tail}$   
 $\text{id\_list\_tail} ::= \mathbf{;}$

$\text{id\_list}$

Remaining Input:  
A, B, C;

Match!

# Another LL(1) Parsing Example

```
id_list ::= id id_list_tail  
id_list_tail ::= , id id_list_tail  
id_list_tail ::= ;
```

Remaining Input:

Sentential Form:  
`id(A) , id(B) , id(C) ;`

Applied Production:

# Predictive Parsing

Basic idea:

a string of symbols

For any two productions  $A ::= \alpha \mid \beta$ , we would like a distinct way of choosing the correct production to expand.

For some rhs  $\alpha \in G$ , define  $\text{FIRST}(\alpha)$  as the set of tokens that appear as the first symbol in some string derived from  $\alpha$ .

<https://powcoder.com>

Add WeChat powcoder

That is

$x \in \text{FIRST}(\alpha)$  iff  $\alpha \Rightarrow^* x\gamma$  for some  $\gamma$

# Revisiting the id\_list Example

```
id_list ::= id id_list_tail  
id_list_tail ::= , id id_list_tail  
id_list_tail ::= ;
```

Remaining Input:  
    , B , C ;

<https://powcoder.com>

Add WeChat powcoder

Applied Production:

# Revisiting the id\_list Example

```
id_list ::= id id_list_tail  
id_list_tail ::= , id id_list_tail  
id_list_tail ::= ;
```

Remaining Input:  
    **,** **B** **,** **C** **;**

Applied Production:  
 $\text{id\_list\_tail} ::= \text{, id id\_list\_tail}$

L
E
A
R
T

```

id_list ::= id id_list_tail
id_list_tail ::= , id id_list_tail
id_list_tail ::= ;

```

## Remaining Input:

**□**, **B**, **C** ;

Applied Production:  
 $\text{id list tail} ::= , \text{id id list tail}$

# Revisiting the id\_list Example

```
id_list ::= id id_list_tail  
id_list_tail ::= , id id_list_tail  
id_list_tail ::= ;
```

Remaining Input:

,B , C ;

<https://powcoder.com>

Add WeChat powcoder

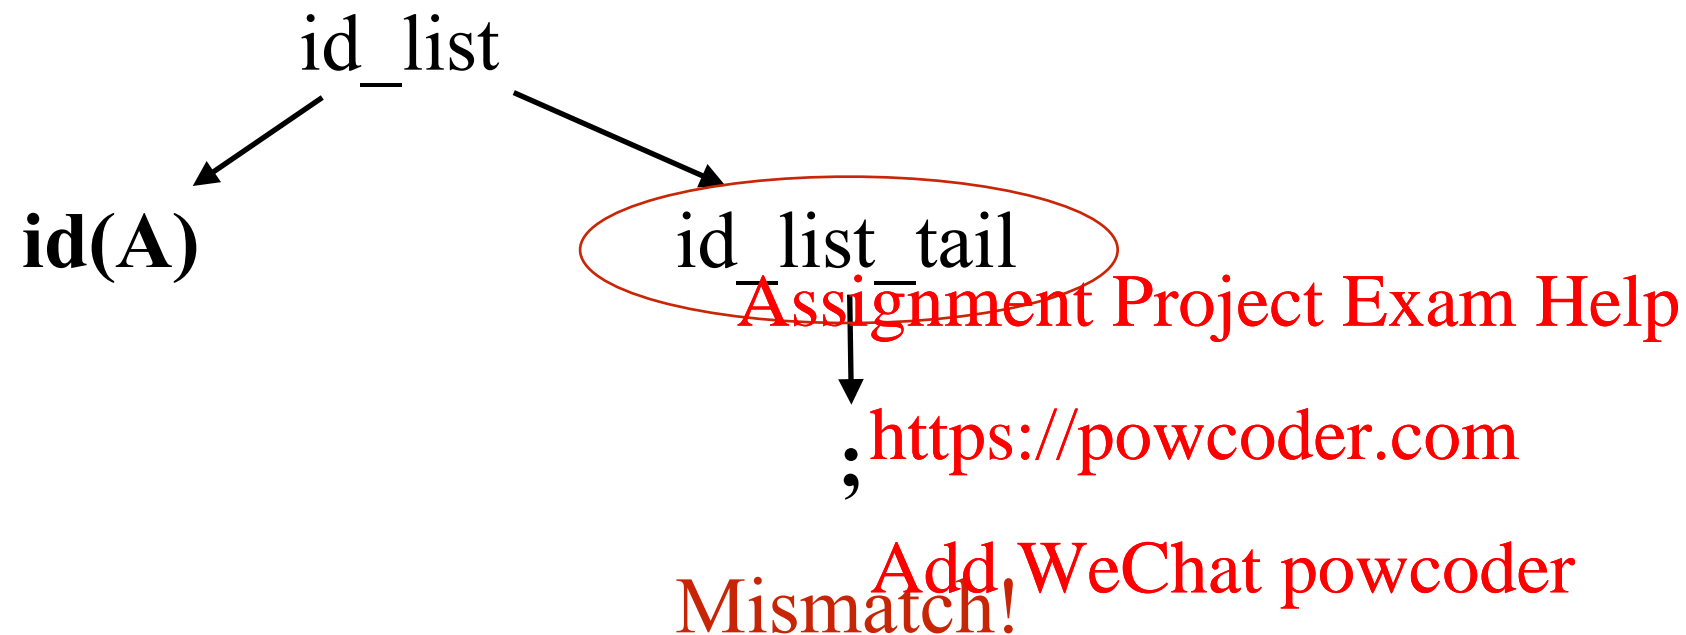

Applied Production:

# Revisiting the id\_list Example

```
id_list ::= id id_list_tail
id_list_tail ::= , id id_list_tail
id_list_tail ::= ;
```

Remaining Input:

,B , C ;

Applied Production:

~~id\_list\_tail ::= ;~~

# Revisiting the id\_list Example

$$\begin{aligned}\text{id\_list} &::= \mathbf{id} \text{id\_list\_tail} \\ \text{id\_list\_tail} &::= \mathbf{, id id\_list\_tail} \\ \text{id\_list\_tail} &::= \mathbf{;} \end{aligned}$$

Remaining Input:  
    , B , C ;

Assignment Project Exam Help

$FIRST( \mathbf{, id id\_list\_tail} ) = \{ \mathbf{,} \}$

$FIRST( \mathbf{;} ) = \{ \mathbf{;} \}$

<https://powcoder.com>

Add WeChat powcoder

Given **id\_list\_tail** as the first **non-terminal** to expand in the tree:

If the first token of remaining input is “,” we choose the rule

$$\text{id\_list\_tail} ::= \mathbf{, id id\_list\_tail}$$

If the first token of remaining input is “;” we choose the rule

$$\text{id\_list\_tail} ::= \mathbf{;}$$

# Predictive Parsing

---

## Key Property:

Whenever two productions  $A ::= \alpha$  and  $A ::= \beta$  both appear in the grammar, we would like

- $FIRST(\alpha) \cap FIRST(\beta) = \emptyset$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Revisiting the id\_list Example

$$\begin{aligned}\text{id\_list} &::= \mathbf{id} \text{id\_list\_tail} \\ \text{id\_list\_tail} &::= , \mathbf{id} \text{id\_list\_tail} \\ \text{id\_list\_tail} &::= ;\end{aligned}$$

Remaining Input:  
    , B , C ;

$FIRST( , \mathbf{id} \text{id\_list\_tail} ) = \{ , \}$

Assignment Project Exam Help

$FIRST( ; ) = \{ ; \}$

<https://powcoder.com>

$FIRST( , \mathbf{id} \text{id\_list\_tail} ) \cap FIRST( ; ) = \emptyset$

Add WeChat-powcoder

Given `id_list_tail` as the first **non-terminal** to expand in the tree:

If the first token of remaining input is `,` we choose the rule

$$\text{id\_list\_tail} ::= , \mathbf{id} \text{id\_list\_tail}$$

If the first token of remaining input is `;` we choose the rule

$$\text{id\_list\_tail} ::= ;$$

# Predictive Parsing

## Key Property:

Whenever two productions  $A ::= \alpha$  and  $A ::= \beta$  both appear in the grammar, we would like

- $FIRST(\alpha) \cap FIRST(\beta) = \emptyset$

Assignment Project Exam Help

<https://powcoder.com>

This rule is intuitive. However, it is not enough, because it doesn't handle  $\epsilon$  rules. How to handle  $\epsilon$  rules?

# Revisiting the LL(1) Parsing Example

$S ::= a S b \mid \epsilon$

Remaining Input:

**b** b b

Assignment Project Exam Help

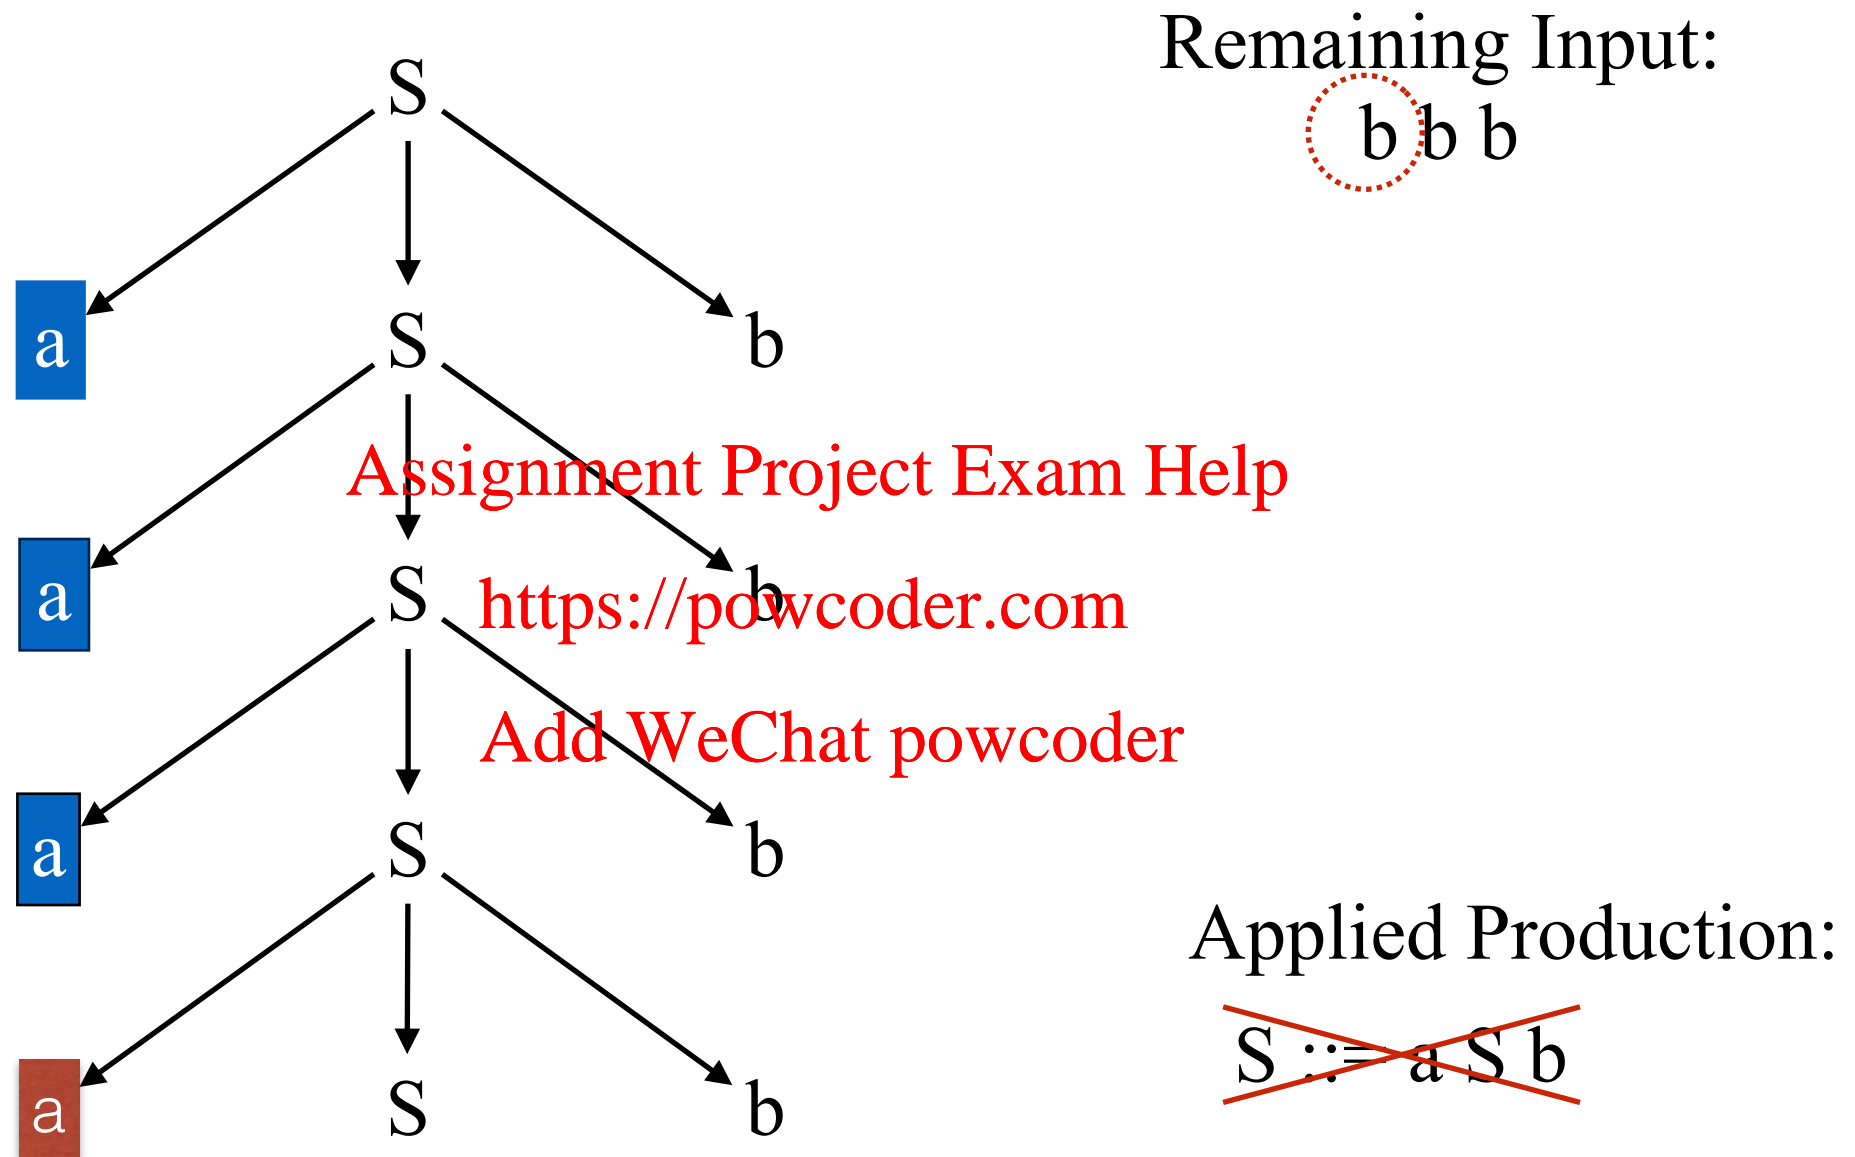

<https://powcoder.com>

Add WeChat powcoder

Applied Production:

# Revisiting the LL(1) Parsing Example

$S ::= a S b \mid \epsilon$

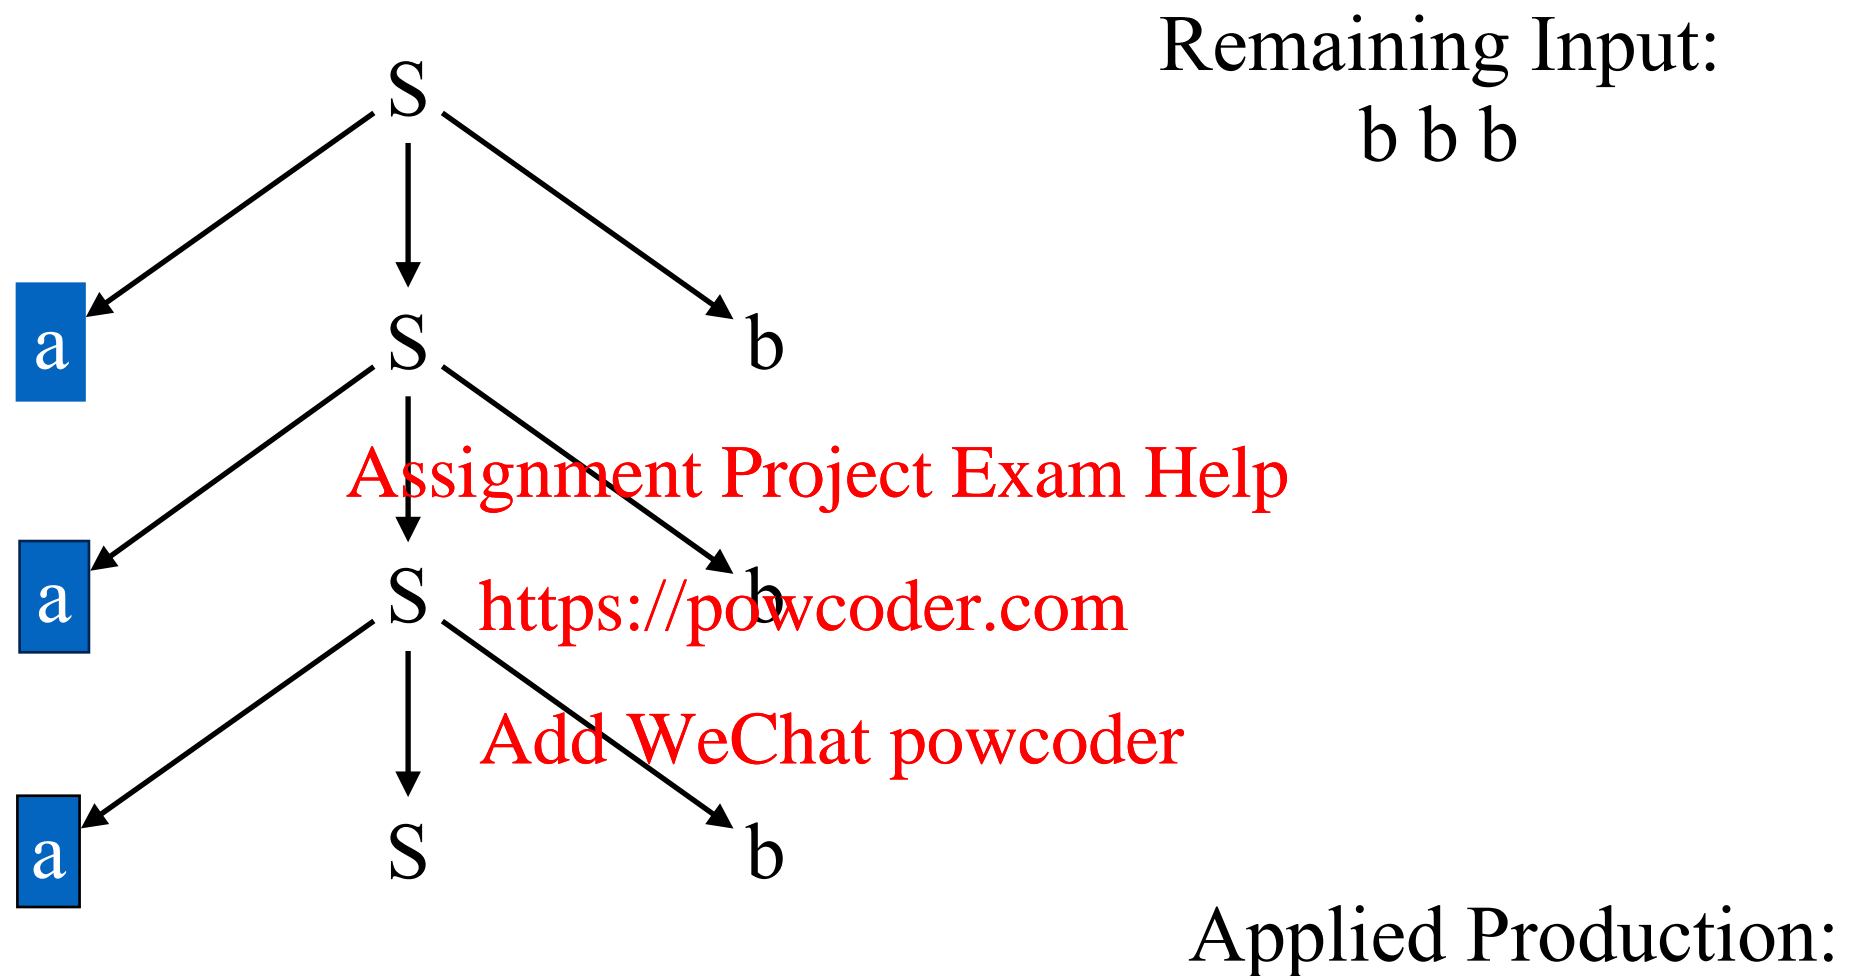

Mismatch!

It only means  $S ::= a S b$  is not the right production rule to use!

# Revisiting the LL(1) Parsing Example

$S ::= a S b \mid \epsilon$

# Revisiting the LL(1) Parsing Example

$S ::= a S b \mid \varepsilon$

$S ::= \varepsilon$  turns out to be the right rule later.

However, at this point,  $\varepsilon$  does not match “b” either !

# Predictive Parsing

---

For a non-terminal  $A$ , define **FOLLOW**( $A$ ) as the set of terminals that can appear immediately to the right of  $A$  in some sentential form.

Thus, a non-terminal's **FOLLOW** set specifies the tokens that can legally appear after it. A terminal symbol has no **FOLLOW** set.

Assignment Project Exam Help

<https://powcoder.com>

FIRST and FOLLOW sets can be constructed automatically

# Predictive Parsing

---

## Key Property:

Whenever two productions  $A ::= \alpha$  and  $A ::= \beta$  both appear in the grammar, we would like

- $FIRST(\alpha) \cap FIRST(\beta) = \emptyset$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

This would allow the parser to make a correct choice with a lookahead of only one symbol!

# Predictive Parsing

---

## Key Property:

Whenever two productions  $A ::= \alpha$  and  $A ::= \beta$  both appear in the grammar, we would like

- $FIRST(\alpha) \cap FIRST(\beta) = \emptyset$ , and
- if  $\alpha \Rightarrow^* \epsilon$ , then  $FIRST(\beta) \cap FOLLOW(A) = \emptyset$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

This would allow the parser to make a correct choice with a lookahead of only one symbol!

# Predictive Parsing

## Key Property:

Whenever two productions  $A ::= \alpha$  and  $A ::= \beta$  both appear in the grammar, we would like

- $FIRST(\alpha) \cap FIRST(\beta) = \emptyset$ , and
- if  $\alpha \Rightarrow^* \epsilon$ , then  $FIRST(\beta) \cap FOLLOW(A) = \emptyset$
- Analogue case for  $\beta \Rightarrow^* \epsilon$ . Note: due to first condition, at most one of  $\alpha$  and  $\beta$  can derive  $\epsilon$ .

This would allow the parser to make a correct choice with a lookahead of only one symbol!

# LL(1) Grammar

---

Define  $PREDICT(A ::= \delta)$  for rule  $A ::= \delta$

- $FIRST(\delta) - \{ \epsilon \} \cup Follow(A)$ , if  $\epsilon \in FIRST(\delta)$
- $FIRST(\delta)$  otherwise

---

Assignment Project Exam Help

# Predictive Parsing

Now, a predictive parser looks like:

Rather than writing code, we build tables.  
Building tables can be automated!

# Predictive Parsing

Now, a predictive parser looks like:

Rather than writing code, we build tables.  
Building tables can be automated!

# Recursive Descent Parsing

---

Now, we can produce a recursive descent parser for our LL(1) grammar.

Recursive descent is one of the simplest parsing techniques used in practical compilers:

- Each **non-terminal** has an associated parsing procedure that can recognize any sequence of tokens generated by that **non-terminal**
- There is a main routine to initialize all globals (e.g: *tokens*) and call the start symbol. On return, check whether `token==eof`, and whether errors occurred
- Within a parsing procedure, both **non-terminals** and terminals can be matched:
  - ▶ non-terminal A: call procedure for A
  - ▶ token t: compare t with current input token; if matched, consume input, otherwise, ERROR
- Parsing procedure may contain code that performs some useful “computations” (*syntax directed translation*)

# Recursive Descent Parsing (pseudo code)

	a	b	eof	other
S	aSb	$\epsilon$	$\epsilon$	error

Assignment Project Exam Help

```
main: {  
    token := next_token();  
    if (S( ) and token == eof) print "accept" else print "error";  
}
```

# Recursive Descent Parsing (pseudo code)

	a	b	eof	other
S	aSb	$\epsilon$	$\epsilon$	error

```
bool S: {
    switch token {
        case a: token := next_token( );
                call S( );
                if (token == b) {
                    token := next_token( );
                    return true;
                }
                else
                    return false;
                break;
        case b:
        case eof: return true;
                break;
        default: return false;
    }
}
```
