Review: Lambda Calculus - Historical Origin

- Church's model of computing is called the *lambda calculus*

It is based on the notion of parameterized expressions (with each parameter introduced by an occurrence of the letter λ — hence the notation's name). Lambda calculus was the inspiration for functional programming: one uses it to compute by *substituting parameters into expressions*, just as one computes in a high level functional program by *passing arguments to functions*.

<https://powcoder.com>

Add WeChat powcoder

Review: Functional Programming

- Functional languages such as Lisp, Scheme, FP, ML, Miranda, and Haskell are an attempt to realize Church's lambda calculus in practical form as a programming language
 - **The key idea: do everything by composing functions**
 - No mutable state
 - No side effects
 - Function as first-class values
- <https://powcoder.com>
- Add WeChat powcoder

Review: Lambda Calculus

λ -terms are inductively defined.

A λ -term is:

- a variable x
- $(\lambda x. M) \Rightarrow$ where x is a variable and λ is a λ -term (abstraction)
- $(M N) \Rightarrow$ where M and N are both λ -terms (application)

Assignment Project Exam Help

Add WeChat powcoder

Review: λ -terms

The context-free grammar for λ -terms:

λ -term	\rightarrow	expr
expr	\rightarrow	name number λ name . expr func arg
func	\rightarrow	name (λ name . expr) func arg
arg	\rightarrow	name number (λ name expr) (func arg)

Example 1:

<https://powcoder.com>

λ y . y x

name (as parameter) expr (another λ -term)

Review: λ -terms

The context-free grammar for λ -terms:

λ -term	\rightarrow	expr
expr	\rightarrow	name number λ name . expr func arg
func	\rightarrow	name (λ name . expr) func arg
arg	\rightarrow	name number (λ name expr) (func arg)

Example 2:

<https://powcoder.com>

Review: Lambda Calculus

Associativity and Precedence

- Function application is left associative: $(f\ g\ z)$ is $((f\ g)\ z)$
- Function application has precedence over function abstraction.
“function body” extends as far to the right as possible:

$(\lambda x.yz)$ is $(\lambda x.(yz))$

- Multiple arguments: $(\lambda xy.z)$ is $(\lambda x(\lambda y.z))$

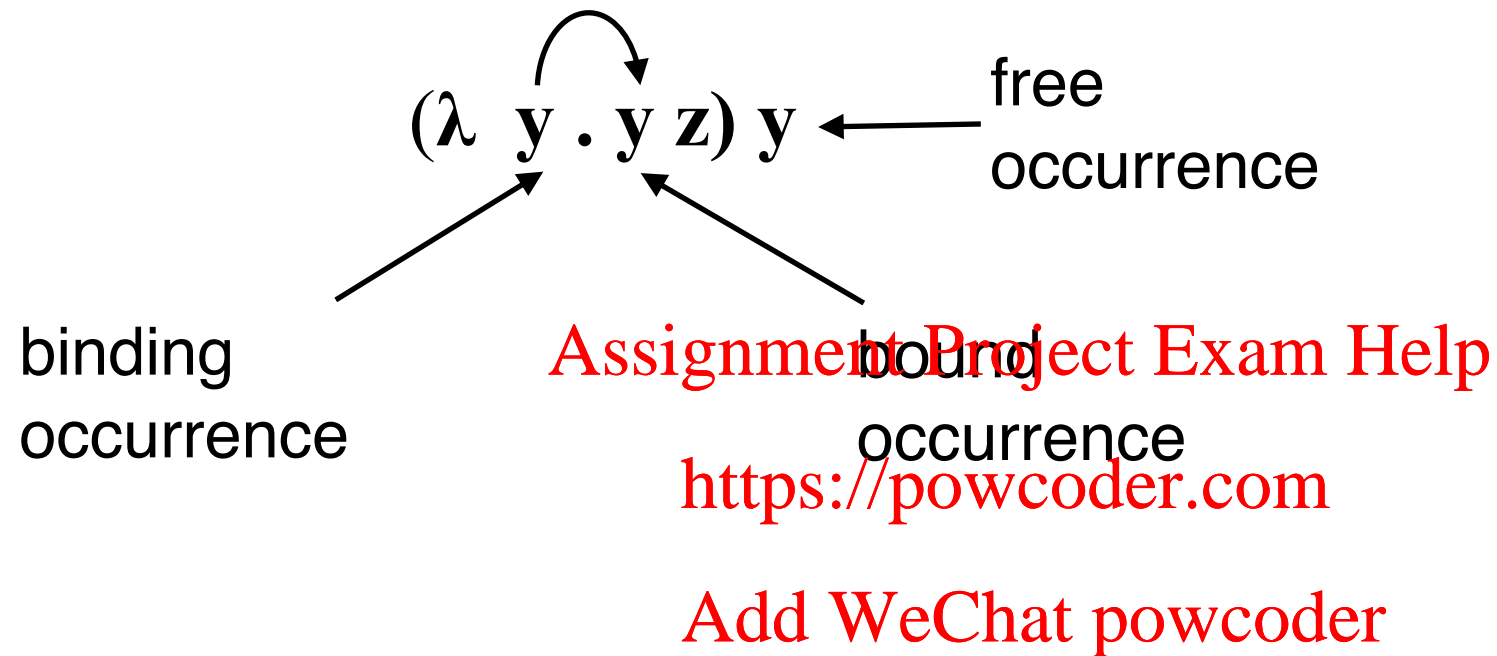

Assignment Project Exam Help

Add WeChat powcoder

Review: Free and Bound Variables

Abstraction $(\lambda x. M)$ “binds” variable x in “body” M . You can think of this as a declaration of variable x with scope M .

Review: Free and Bound Variables

Note:

A variable can occur **free** and **bound** in a λ -term.

Example:

“free” is relative to a λ -sub-term.

Review: Free and Bound Variables

Let M, N be λ -terms and x is a variable. The set of *free variable* of M , $\text{free}(M)$, is defined inductively as follows:

- $\text{free}(x) = \{x\}$
- $\text{free}(M N) = \text{free}(M) \cup \text{free}(N)$
- $\text{free}(\lambda x.M) = \text{free}(M) - \text{free}(x)$

Review: Function Application

Computation in lambda calculus is based on the concept of reduction. Simplify an expression until it can no longer be simplified.

β –reduction:

$$(\lambda x.E)y \rightarrow_{\beta} E[y/x]$$

- Assignment Project Exam Help

 1. Return function body E
 2. Replace every <https://powcoder.com> in E with y

Add WeChat powcoder

Review: Function Application

Computation in lambda calculus is based on the concept of reduction. Simplify an expression until it can no longer be simplified.

β –reduction:

$$(\lambda x.E)y \rightarrow_{\beta} E[y/x]$$

- Assignment Project Exam Help
<https://powcoder.com>
Add WeChat powcoder
1. Return function body E
 2. Replace every occurrence of x in E with y

Example:

$$\begin{aligned} (\lambda a.\lambda b.a+b) 2 x &\rightarrow_{\beta} (\lambda b.2+b) x \\ &\rightarrow_{\beta} 2+x \end{aligned}$$

Function Application

Computation in lambda calculus is based on the concept of reduction. Simplify an expression until it can no longer be simplified.

β -reduction:

$$(\lambda x.E)y \rightarrow_{\beta} E[y/x]$$

Assignment Project Exam Help

We should not perform β -reduction if y is a bound variable within E

Add WeChat powcoder

Example:

$$\begin{array}{ccc} (\lambda a. \lambda b. a+b) \ b \ 2 & \rightarrow_{\beta} & (\lambda b. b+b) \ 2 \\ & & \rightarrow_{\beta} \ 2+2 \end{array}$$

↓

Incorrect

b is a bound variable within $\lambda a. \lambda b. a+b$

This is called capturing

Review: Function Application

Computation in lambda calculus is based on the concept of reduction. Simplify an expression until it can no longer be simplified.

α -reduction:

$$(\lambda x.E) \rightarrow_{\alpha} \lambda y.E[y/x]$$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Review: Function Application

Computation in lambda calculus is based on the concept of reduction.
Simplify an expression until it can no longer be simplified.

α -reduction:

$$(\lambda x.E) \rightarrow_{\alpha} \lambda y.E[y/x]$$

Perform α -reduction first

Assignment Project Exam Help

Example:

$$\begin{aligned} (\lambda a.\lambda b.a+b) \ b \ 2 &\rightarrow_{\alpha} (\lambda a.\lambda x.a+x) \ b \ 2 \\ &\rightarrow_{\beta} \lambda x.b+x \ 2 \\ &\rightarrow_{\beta} b+2 \end{aligned}$$

Add WeChat powcoder

Review: Programming in Lambda Calculus

Remember: Computation in the lambda calculus is a sequence of applications of reduction rules (mostly β -reductions).

Logical constants and operations (incomplete list):

true $\equiv \lambda a. \lambda b. a$

select-first

false $\equiv \lambda a. \lambda b. b$

select-second

Assignment Project Exam Help

cond $\equiv \lambda p. \lambda m. \lambda n. (p\ m\ n)$

<https://powcoder.com>

not $\equiv \lambda x. (x\ \text{false}\ \text{true})$

Add WeChat powcoder

and $\equiv \lambda x. \lambda y. (x\ y\ \text{false})$

or $\equiv \text{homework}$

Review: Programming in Lambda Calculus

What about data structures?

Data structures:

pairs can be represented as:

$$[M\ N] \equiv \lambda z. (z\ M\ N)$$

<https://powcoder.com>

first	$\equiv \lambda x. (x\ \text{true})$	Add WeChat powcoder	(car)
second	$\equiv \lambda x. (x\ \text{false})$		(cdr)
build	$\equiv \lambda x. \lambda y. \lambda z. (z\ x\ y)$		(cons)

Programming in Lambda Calculus

What about the encoding of arithmetic constants?

Church Numerals:

$0 \equiv \lambda f x. x$

$1 \equiv \lambda f x. (f x)$

$2 \equiv \lambda f x. (f (f x))$

...

$n \equiv \lambda f x. (f (f (\dots (f x) \dots))) \equiv \lambda f x. (f^n x)$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

The natural number n is represented as a function that applies a function f n -times to x .

succ $\equiv \lambda m. (\lambda f x. (f (m f x)))$

add $\equiv \lambda m n. (\lambda f x. ((m f) (n f x)))$

mult $\equiv \lambda m n. (\lambda f x. ((m (n f)) x))$

isZero? $\equiv \lambda m. (m \lambda x. \text{false} \text{ true})$

Recursion in Lambda Calculus

Does this make sense?

$$f \equiv \dots f \dots$$

In lambda calculus, \equiv is “abbreviated as”, **but not an assignment.**

Recursion in Lambda Calculus

Does this make sense?

$$f \equiv \dots f \dots$$

In lambda calculus, \equiv is “abbreviated as”, **not an assignment**.

$$\text{add} \equiv \lambda mn. (\text{if (isZero?n) m (add (m+1) (n-1)) })$$

Incorrect! add is not defined

<https://powcoder.com>

How about

Add WeChat powcoder

$$\lambda f. (\lambda mn. (\text{if (isZero?n) m (f (m+1) (n-1)) })) \text{add}$$

F

$$\lambda mn. (\text{if (isZero?n) m (add (m+1) (n-1)) }) = \text{add}$$

$$F \text{ add} = \text{add}$$

“add” is a fixed point to function F

Function Fixed Points

The fixed point of a function g is the set of values

$$\{ x \mid x = g(x) \}$$

Examples:

function g	$\text{fix}(g)$
$\lambda x.6$	$\{6\}$
$\lambda x.(6 - x)$	$\{3\}$
$\lambda x.((x * x) + (x - 4))$	$\{-2, 2\}$
$\lambda x.x$	entire domain of function f
$\lambda x.(x + 1)$	$\{ \}$

Function Fixed Points

Is there a way to “compute” the fixed point of any function F

$$x = F(x)$$

YES. $x = YF$, and Y is called the fixed point combinator.

$$Y \equiv \lambda f. (\lambda x. f(x x)) (\lambda x. f(x x))$$

<https://powcoder.com>

$$YF = ((\lambda f. ((\lambda x. f(x x)) (\lambda x. f(x x)))) F)$$

Function Fixed Points

Is there a way to “compute” the fixed point of any function F

$$x = F(x)$$

YES. $x = YF$, and Y is called the fixed point combinator.

$$Y \equiv \lambda f. (\lambda x. f(x x)) (\lambda x. f(x x))$$

<https://powcoder.com>

$$YF = ((\lambda f. ((\lambda x. f(x x)) (\lambda x. f(x x)))) F)$$

Function Fixed Points

Is there a way to “compute” the fixed point of any function F

$$x = F(x)$$

YES. $x = YF$, and Y is called the fixed point combinator.

$$Y \equiv \lambda f. (\lambda x. f(x x)) (\lambda x. f(x x))$$

<https://powcoder.com>

$$\begin{aligned} YF &= ((\lambda f. (\lambda x. f(x x)) (\lambda x. f(x x)))) F \\ &= (\lambda x. F(x x)) (\lambda x. F(x x)) \end{aligned}$$

Function Fixed Points

Is there a way to “compute” the fixed point of any function F

$$x = F(x)$$

YES. $x = YF$, and Y is called the fixed point combinator.

$$Y \equiv \lambda f. (\lambda x. f(x x)) (\lambda x. f(x x))$$

<https://powcoder.com>

$$\begin{aligned} YF &= ((\lambda f. ((\lambda x. f(x x)) (\lambda x. f(x x)))) F) \\ &= (\lambda x. F(\underline{x x})) \underline{(\lambda x. F(x x))} \end{aligned}$$

Function Fixed Points

Is there a way to “compute” the fixed point of any function F

$$x = F(x)$$

YES. $x = YF$, and Y is called the fixed point combinator.

$$Y \equiv \lambda f. (\lambda x. f(x x)) (\lambda x. f(x x))$$

<https://powcoder.com>

$$\begin{aligned} YF &= ((\lambda f. ((\lambda x. f(x x)) (\lambda x. f(x x)))) F) \\ &= (\lambda x. F(\underline{x x})) (\lambda x. F(\underline{x x})) \\ &= F((\lambda x. F(x x)) (\lambda x. F(x x))) \end{aligned}$$

Function Fixed Points

Is there a way to “compute” the fixed point of any function F

$$x = F(x)$$

YES. $x = YF$, and Y is called the fixed point combinator.

$$Y \equiv \lambda f. (\lambda x. f(x x)) (\lambda x. f(x x))$$

<https://powcoder.com>

$$YF = ((\lambda f. ((\lambda x. f(x x)) (\lambda x. f(x x)))) F)$$

$$YF = (\lambda x. F(x x)) (\lambda x. F(x x))$$

$$YF = F((\lambda x. F(x x)) (\lambda x. F(x x)))$$

Function Fixed Points

Is there a way to “compute” the fixed point of any function F

$$x = F(x)$$

YES. $x = YF$, and Y is called the fixed point combinator.

$$Y \equiv \lambda f. (\lambda x. f(x x)) (\lambda x. f(x x))$$

<https://powcoder.com>

$$YF = ((\lambda f. ((\lambda x. f(x x)) (\lambda x. f(x x)))) F)$$

$$YF = (\lambda x. F(x x)) (\lambda x. F(x x))$$

$$YF = F((\lambda x. F(x x)) (\lambda x. F(x x)))$$

$$YF = F(YF)$$

The Y - Combinator Example (Cont.)

- Informally, the Y-Combinator allows us to get as many copies of the recursive procedure body as we need. The computation “unrolls” recursive procedure calls one at a time

$$Y \equiv \lambda f.((\lambda x.f(x\ x)) (\lambda x.f(x\ x)))$$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

The Y - Combinator

Example:

$F \equiv \lambda f. (\lambda mn. \text{if } (\text{isZero? } n) \text{ then } m \text{ else } (f \text{ (succ } m) \text{ (pred } n)))$

$(YF \ 3 \ 2) = (((\lambda f.((\lambda x.f(x \ x)) (\lambda x.f(x \ x)))) F) \ 3 \ 2)$
 $= ((F \ (YF)) \ 3 \ 2)$
 $= ((\lambda mn.\text{if } (\text{isZero? } n) \text{ then } m \text{ else } YF \text{ (succ } m) \text{ (pred } n))) \ 3 \ 2)$
 $= \text{if } (\text{isZero? } 2) \text{ then } 3 \text{ else } YF \text{ (succ } 3) \text{ (pred } 2))$
 $= (YF \ 4 \ 1)$
 $= ((F \ (YF)) \ 4 \ 1)$
 $= \text{if } (\text{isZero? } 1) \text{ then } 4 \text{ else } YF \text{ (succ } 4) \text{ (pred } 1))$
 $= (YF \ 5 \ 0)$
 $= (F \ (YF) \ 5 \ 0)$
 $= \text{if } (\text{isZero? } 0) \text{ then } 5 \text{ else } (YF \text{ (succ } 5) \text{ (pred } 0))$
 $= 5$

Lambda Calculus - Final Remarks

- We can express all computable functions in our λ -calculus.
- All computable functions can be expressed by the following two combinators, referred to as **S** and **K**.
 - $K \equiv \lambda xy.x$
 - $S \equiv \lambda xyz.xz(yz)$

Combinatoric logic is as powerful as Turing Machines.
